Preventing the Digital Dump: Ending “Re-use Abuse”

Today, as electronic gadget consumption skyrockets and obsolescence renders electronic equipment useless in a matter of a few short years, we are increasingly faced with mountains of toxic electronic waste. For a variety of motivations, both good and bad, this e-waste is increasingly sold and exported from rich developed countries to developing countries for the stated purpose of re-use. Such re-use exports have been touted as a means to bridge the “digital divide” and satisfy the great desire and need in the developing world to become a part of the information age through access to information technology. However, there is a very ugly side to this “re-use” trade as well and it is time that we begin to be able to tell the difference.

Re-use: The Good

Re-use, directly or via repair or refurbishment is usually the preferable option over recycling and disposal from an environmental perspective. Re-use can extend product life and means less environmentally damaging extraction, less energy consumption, less waste. Re-use of second-hand equipment can also often mean a lower price for products, thus increasing accessibility for more people who might otherwise not be able to afford the product. But, as shall be shown, these worthy goals alone, without a good measure of “responsibility” backed up by law, can perversely become a highway to a “digital dump,” instead of a bridge over the “digital divide.”

Re-use: The Bad

In late 2005, BAN conducted an extensive 10-day investigation in Lagos, Nigeria to better understand the burgeoning reuse/repair trade. That investigation revealed a major and growing influx of e-scrap that was not being controlled by the Basel Convention despite the fact that as much as 75% of the material was strictly waste, as all or part of it could not be repaired or re-used even in a country with excellent and affordable electronic engineers. Consequently this toxic e-waste was simply dumped and burned in waysides in Lagos, leading to serious environmental and health impacts.

Since then, additional investigations indicate that the report and film The Digital Dump represented just the first ripple of a tsunami of such re-use exports, which are often cloaked by the seeming intent of “helping the poor” and exploiting an arena of trade which has not been well controlled by customs authorities. Recent visits to Ghana have revealed similar floods of e-waste and even working computer monitors arriving in the port of Accra are currently being smashed and burned for lack of a market. These glimpses of how this trade really occurs today has led us to the following conclusions:

- Without mandatory testing and controls, “reuse” can be a pretext for exporting junk: Most e-waste is hazardous by definition and thus meant to be controlled by the Basel Convention. But with vague definitions of “waste”, legal ambiguity becomes the norm and thus enforcement has not been as diligent as necessary. Mandatory testing, certification of full functionality are the needed remedy.

- Export for repair usually involves export for disposal: Export for repair usually involves almost immediate disposal of hazardous parts when bad parts are replaced. For example most repairs are made by swapping out faulty circuit boards and discarding the old one. Thus by Basel definitions (Art. 1, Annexes I, III and IV), export for repair likely involves transboundary movement of hazardous waste. Testing then is necessary prior to export to ensure no hazardous parts will need to be removed or else be subject to Basel Convention controls.

- Export for reuse may not always be the preferable waste management option for a technology that undergoes rapid obsolescence: The “digital divide” cannot be defined by the difference between those with computers (no matter how old) and those without, but rather by those with state-of-art computers and those without. A hand-me-down solution to the problem of the “digital divide,” then, will never completely eliminate the gap. And due to the very rapid obsolescence of IT technology today, this gap occurs very rapidly. Seen in this light, it is not always so charitable to provide hand-me-down technology which will become outdated in but a few years, particularly when that technology carries with it a substantial environmental burden. This is particularly true when weighed against other policy options, such as demanding toxics use reductions and investing in indigenous IT industries in developing countries.

- Exporting toxic equipment for reuse to poorer consumers equates to “passing the toxic buck” and environmental injustice: If the solution of handing-down toxic technology from rich to poor becomes the norm on this finite planet known for its very inequitable economic geography, a very convenient world is created for some. In
The important question of when electronic equipment should be considered a waste and when a non-waste is the subject of the newest guideline technical guideline. E-waste is the most traded hazardous waste today, causing the most harm to developing countries, and thus this “Guideline” and subsequent amendments to the Convention will be decisive as to the efficacy of the Convention. And it is within this Guideline context that we have seen the latest efforts to use “re-use” as a pretext for skirting Convention and Ban obligations.

While this Guideline asserts the basic premise that non-functional, or untested equipment will be considered waste, major exemptions are proposed in a new Paragraph 26b by some industry actors and countries like Japan, US and Canada.

**Conclusion: Non-Functional or Untested Electronic Equipment is Waste**

It is clear that it has become far too easy for waste brokers to simply make a claim of re-use and all manner of useless junk can then be exported while customs officials are forced to simply take their word for it. That must stop and we need clear guidance to all countries to that effect.

Currently, the Basel Convention is creating a new Technical Guideline on the Transboundary Movement of Electronic Waste. It is essential that this guideline not be allowed to undermine the spirit or letter of the Basel Ban Amendment and the basic obligations of the Basel Convention by creating new sweeping exemptions to our basic waste definitions.
